

## Week 12

- Getting Data

## Getting Data

# Outcomes for this evening

By the end of today's class, you should be able to do the following:

- Describe how your computer accesses content on the Internet
- Scrape content from websites using Python libraries
- Explain the moral and ethical issues of scraping
- Demonstrate use of APIs
- Extract content from documents (PDF, DOCX, RTF) and from webpages (HTML using BeautifulSoup)

- Science
- Getting Data using Computers
- Scraping Data
- APIs
- Activity: Negotiating for Data
- Get Data from Documents
- Fake Data
- Homework

# "Data Science" without Science

- Getting data and using Python does not make you a Data Scientist

*Steps commonly observed in practice:*

- data gathering
- cleaning data
- data analysis
- data visualization

--> That doesn't mean you are applying a scientific process

# What is Science?

Science is a systematic enterprise that builds and organizes knowledge in the form of testable explanations and predictions about the universe.

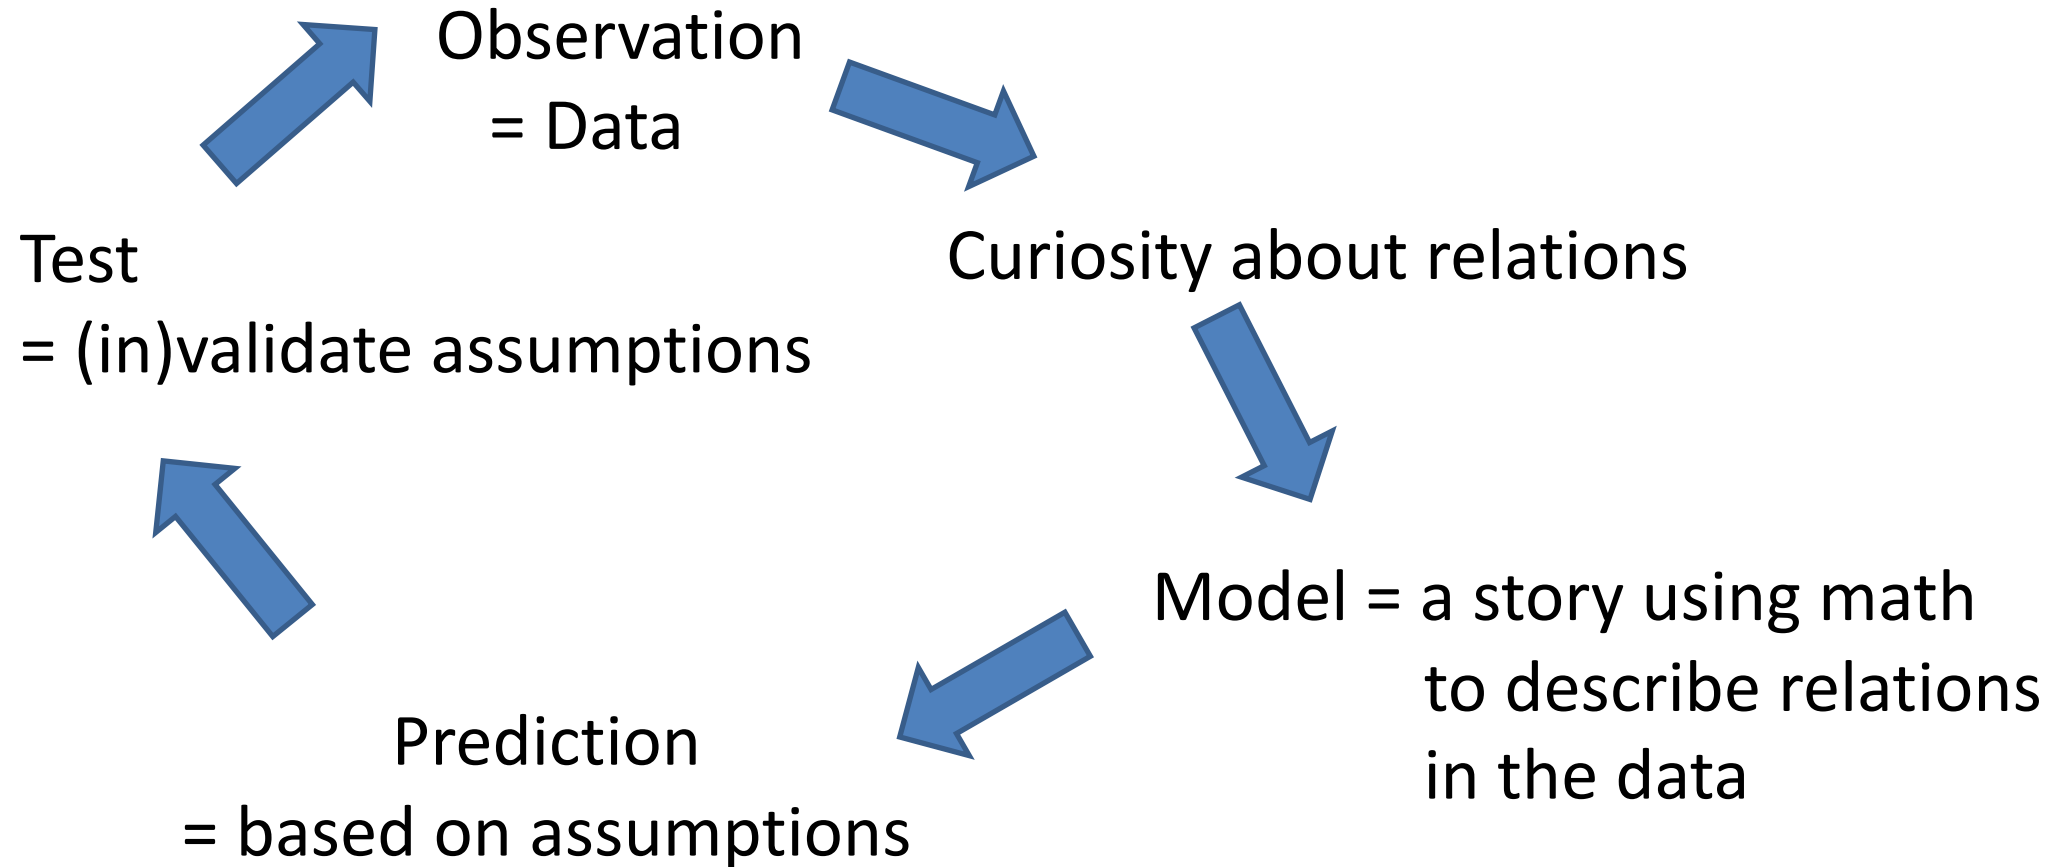

<https://en.wikipedia.org/wiki/Science>

What is your  
perception of the  
process of Science?

Activity:

# How to Science

# Make a claim, Test the claim

A claim should be [falsifiable](#). The test should be [statistically meaningful](#).

*In practice, strictness depends on intended outcome.*

Good enough to make money:

- Altering what color the button on your ecommerce website is to maximize sales
- Recommending a movie to viewers

Critical to safety or health of humans:

- Determining which dosage of a drug is efficacious for medical treatments
- Guidance for an autonomous vehicle

## *Hard task in Science:* Reproducibility

Someone else, following only your documentation, should be able to get an outcome that validates your claim.

An investment without immediate benefit.

Who's impacted by reproducibility: your future self; others.

# Example reasons why reproducibility fails

- The outcome was specific to the data used
- Assumptions were wrong
- Software implementation has a bug
- Documentation provided is insufficient to enable reproducibility

## *Activity*: Coding

- Homework Review

- ~~Science~~
- Final Project
- Getting Data using Computers
- Scraping Data
- APIs
- Activity: Negotiating for Data
- Get Data from Documents
- Fake Data
- Homework

## *You pick the data source for your project*

from a list I provide, or you provide a suggestion in your proposal.

- Data discovery is outside scope of course, so I provide you data sources
  - You should pick a data source you have some background knowledge in
- > Enables use of a model and generation of hypotheses

# What I care about for the project

Challenge: determine relevant scope appropriate to your skills while still pushing your experience

Report: A description of research methods can be called “coherent” and “complete” when readers understand the process well enough to replicate it themselves. [[citation](#)]

## Analysis

- Applies methods learned in class
- Uses Python 3 in Jupyter notebook
- Demonstrates process of data science, from gathering data to telling story through characterization
- Visualization: Intuitive, relevant

# Example proposal content

The source URL for the data is <http://pinkmonkeys.edu/>. There is no cost to accessing this data. [Does access require creation of an account?]

Accessing this data does not violate any laws. This data does not appear to have been previously analyzed based on a Google search.

A preliminary survey of the data indicates there are 10,000 rows, 20 columns, and the file is 500 kB.

- ~~Science~~
- ~~Final Project~~
- Getting Data using Computers
- Scraping Data
- APIs
- Activity: Negotiating for Data
- Get Data from Documents
- Fake Data
- Homework

# Online digital content

Normally presented via a [GUI](#) ([web browser](#)) for human interaction

# I want all the data

Google has indexed  
trillions of web pages

## Typical data sources

- Web GUI – unstructured text, electronic format
- Databases (SQL, HBase, Accumulo)
- Semi-structured text and mixed media, i.e. Word/PDF documents
- API (REST, SOAP)
- Electronic documents (Word, Powerpoint, Excel)
- Books, papers (hard copy) – unstructured text

*A well-rounded data scientist can extract data from any source*

# How to computer: Internet version

1. Type in web address
2. Get Content

If that's all you know,  
then that's all you can do

# New Knowledge means New Vocabulary

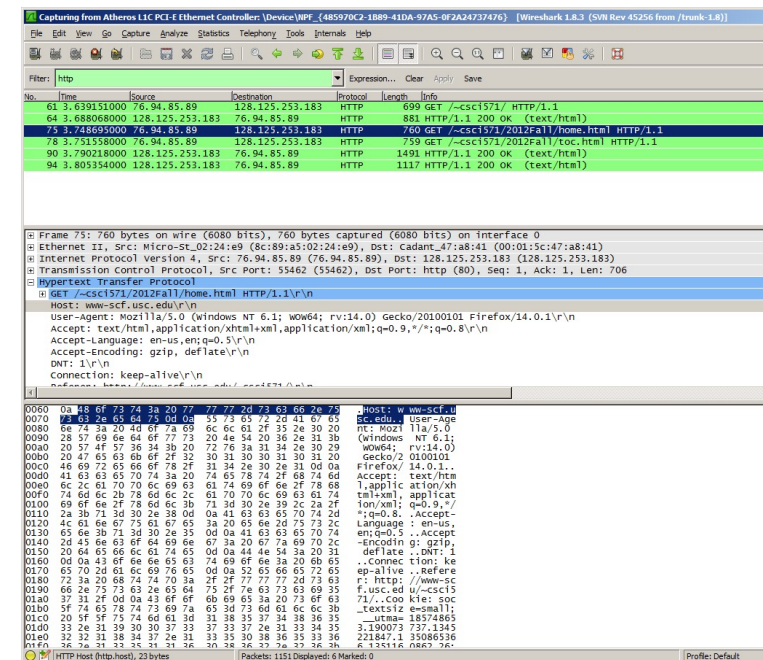

In your role as a data scientist, understanding this jargon enables discussion of processes relevant to getting data

# Packets contain information

- Text
- HTML: Hyper Text Markup Language
- CSS: Cascading Style Sheets
- JavaScript
- Other media, i.e. sound, video, images

As a data scientist, this is likely a layer of knowledge deeper than most of you will care about

# Process of getting a webpage

1. Client computer is connected to Internet and has an address
2. Person on client computer enters URL in web browser
3. [URL](#) is resolved to address of server
4. Using [HTTP](#), browser sends a GET request to the server asking for the file <https://mydomain.com/web-server.htm>
5. Server sends content to client computer
6. Client computer renders the [HTML](#) content as a web page

*Disclaimer:* not describing ports, IP, [DNS](#), TCP/IP, cookies, certs

*Why this matters to you, the data scientist:* when the process fails, your ability to troubleshoot depends on understanding the process

ip.webernetz.net without and with proxy.pcapng [Wireshark 1.10.3 (SVN Rev 53022 from /trunk-1.10)]

*Motivation:* show you that the process of data gathering is composed of understandable steps

# Using computers to do boring repetitive work

There are many software tools to automate getting data on the web

- Curl
- Wget
- Requests
- Scrapy

I will focus on text content

- ~~Science~~
- ~~Final Project~~
- ~~Getting Data using Computers~~
- Scraping Data
- APIs
- Activity: Negotiating for Data
- Get Data from Documents
- Fake Data
- Homework

# "I didn't know that was illegal"

- Ignorance of the law is no defense to criminal charges
- Mistakes happen, but that doesn't mean you're not liable

I am not a lawyer  
This is not legal advice

# Legality of Content Scraping

Web Scraping = automated collection of content

- Few sites make explicit statements about scraping

Example: <https://www.50states.com/terms.htm>

- Web Crawlers
  - consume server resources (CPU, memory, power)
  - consume bandwidth
  - Access parts of sites not commonly accessed by humans

# Instructions for crawlers: [Robots.txt](#)

<http://www.robotstxt.org/robotstxt.html>

- Based on your [user agent](#) string:

<https://www.whatismybrowser.com/detect/what-is-my-user-agent>

- Example robots.txt files:
  - <https://cs.stanford.edu/robots.txt>
  - <https://slashdot.org/robots.txt>

# *Activity*: discuss ethics of scraping content

Let's discuss legal risks and moral issues:

- At what scale does scraping become an issue?  
Just a few pages of content versus an entire domain
- Does your stance change based on who you are getting content from?  
Small business versus large corporation
- Does your position change based on the purpose of scraping?  
For research versus for commercial interest

## *Example of Data Scraping*

- In 2016, "a group of Danish researchers [publicly released](#) a dataset of nearly 70,000 users of the online dating site OkCupid, including usernames, age, gender, location, what kind of relationship (or sex) they're interested in, personality traits, and answers to thousands of profiling questions used by the site."
- <https://www.wired.com/2016/05/okcupid-study-reveals-perils-big-data-science/>

# *Tools for getting content:* wget (22 years old!)

- Normally a command in linux
- supports HTTP, HTTPS and FTP
- able to recover from a prematurely broken transfer

Examples:

```
wget www.fogcam.org
```

```
wget -m --limit-rate=200k http://mysite.com
```

-m=mirror; rate limit to 200 kB/sec

- Can follow links in content
- Also available in Python - <https://pypi.org/project/wget/>

# curl

- Normally a command in linux
- Supports FTP, FTPS, Gopher, HTTP, HTTPS, SCP, SFTP, TFTP, TELNET, DICT, LDAP, LDAPS, FILE, POP3, IMAP, SMB/CIFS, SMTP, RTMP and RTSP

Example:

```
curl www.fogcam.org
```

- Also available in Python as "import pycurl"
- <https://curl.trillworks.com/>
- <http://pycurl.io/docs/latest/index.html>

# Python: [Requests](#)

Send HTTP using Python, get webpage back

getting\_data/get\_1\_requests.ipynb

## Python: Scrapy

- Framework for creating a web crawler
- <https://doc.scrapy.org/en/latest/intro/tutorial.html>

```
conda install -c conda-forge scrapy
```

- A site intended for exploration: <http://toscrape.com/>
  - <http://quotes.toscrape.com/>
  - <http://books.toscrape.com/>

# Having data for a browser is insufficient

- Scraping tools get data from the Internet
- Data for web browsers is not suitable for analysis

**Activity:** view source of <https://www.umbc.edu/>

In Chrome, View > Developer > View Source

In Firefox, Tools > Web Developer > Page Source

# Parsing HTML using BeautifulSoup

- `getting_data/get_2_beautifulsoup.ipynb`
- `getting_data/get_3_table_requests_bs4_pandas.ipynb`
- `getting_data/get_4_requests_bs4_blocked_by_server.ipynb`
- `getting_data/get_5_requests_bs4_table_violates_robots.ipynb`

# Summary of Tools

Getting data:

- Wget
- Curl
- Requests

Analyzing HTML:

- BeautifulSoup

For Data 601, requests + BeautifulSoup is typically relevant

- ~~Science~~

# Scraping data isn't the only path

- <https://www.ssa.gov/oact/babynames/>
- Year and Popularity scale for a List of the Most Popular Names

Can we scrape the data?

- <https://www.ssa.gov/robots.txt>

Do policies allow scraping?

- <https://www.ssa.gov/agency/websitepolicies.html>

# Sometimes data is made available for download

- <https://www.google.com/search?q=site%3Assa.gov+download+baby+names>
- <https://www.google.com/search?q=site%3Assa.gov+api>

In this case, we find the data is available for direct download:

- <https://www.ssa.gov/oact/babynames/limits.html>
- <https://catalog.data.gov/dataset?tags=baby-names>
- <https://www.ssa.gov/open/data/>
- <https://www.ssa.gov/data/>

# Example of a simple API

- <http://swoogle.umbc.edu/SimService/>
- <http://swoogle.umbc.edu/SimService/api.html>
- `getting_data/get_6_requests_use_simple_API.ipynb`

# Constrain access using API keys

- <https://sis.jhu.edu/api> as an alternative to <https://sis.jhu.edu/classes/>
- `getting_data/get_7_requests_use_API_with_key.ipynb`

- ~~Scraping Data~~
- ~~APIs~~
- ~~Activity: Negotiating for Data~~
- ~~Get Data from Documents~~
- Fake Data
- Homework

# When you don't have the data you need

Fake (synthetic) data

- What variables would you need in your model?
- What is the distribution of each variable?
- Expected frequency of measurements?
- Expected number of instances?
- Expected data format (JSON, XML, CSV, HTML, DOCX)
- Expected data type (date strings, text, numbers)

<https://www.generatedata.com/>

<https://www.mockaroo.com/>

# Benefits of using fake data

- No sensitive or confidential information; privacy not at risk
- Enables you to write analysis before you have the data
- Play with visualizations
- Generate report layout
- Negotiate with stakeholders so they have something to point at

# How to create fake data

- Consider the characteristics of the data
  - Name
  - Phone number
  - address
- Create data that has those characteristics
- Create the data structure you want to work with
  - List, table
  - Streaming versus static

- ~~Science~~
- ~~Final Project~~
- ~~Getting Data using Computers~~
- ~~Scraping Data~~
- ~~APIs~~
- ~~Activity: Negotiating for Data~~
- ~~Get Data from Documents~~
- ~~Fake Data~~
- Homework

# Consequences of Exploration

Exploration means you don't know.

- Not all your investments get to the customer
- You will write code you discard
- Perfection is a wasted when exploring

In contrast, product development focuses on what will reach customers in order to minimize costs.

# Data Science doesn't always win

Having a correct and complete solution does not mean it gets selected

Decision makers can be swayed

- By emotionally-driven stories
- On the basis of prior relationships
- To select a cheaper option.

It is vital to determine what convinces your audience before investing effort in Data Science analysis that uses code, data, math.

If your customer plays the lottery, they may not understand your numerical results
